Problem Statement:

The University of ESwatini has been relying on traditional in person voting system and paper-based systems for student elections, which are time consuming, costly and prone to errors. Students face problems such as the need to physically travel to designated polling station, time constraints that restrict voting to fixed schedules (day and time) and manual result tallying that is slow, exposed to human error and vulnerable to fraud. These limitations reduce student engagement, lower participation rates, increased administrative costs, delay election results and increase the risk of disputes. A secure, efficient, and accessible online voting system is needed to overcome these challenges to ensure fair, transparent and accurate elections within the University of ESwatini
